Process exited after 0.125 seconds with return value 0
Press any key to continue . . .
```

Q:2:

Describe the following line of code: `iret1 = pthread_create(&thread1, NULL, print_message_function, (void*) message1);`

- **pthread_create** is a POSIX threads (pthreads) function used to create a new thread.
- **&thread1** is a pointer to a `pthread_t` variable where the thread ID of the newly created thread will be stored.
- **NULL** specifies the thread attributes. Passing `NULL` means the thread is created with default attributes.
- **print_message_function** is the function that the new thread will execute. This function must have the signature `void* function(void*)`.
- **(void*) message1** is a pointer to the argument passed to `print_message_function`. The argument is cast to `(void*)` because pthread functions accept a `void*` argument for generality.

The function returns an integer indicating success or failure:

- On success, `pthread_create` returns 0 and the new thread starts running `print_message_function` with `message1` as its argument.
- The return value is stored in `iret1` to check if thread creation succeeded.
